

### **Listing of Claims**

This listing of claims replaces all prior versions, and listings, of claims in the application:

1. (Previously Presented) A method comprising:  
placing a pellicle within an outer pellicle frame and an inner pellicle frame;  
heating the pellicle, the outer pellicle frame, and the inner pellicle frame above a glass transition temperature of the pellicle and below a melting temperature of the pellicle to attach the pellicle to at least one of the outer pellicle frame and the inner pellicle frame;  
placing a polymer layer between a reticle and a selected one of the outer pellicle frame and the inner pellicle frame;  
and  
heating the polymer layer to a pre-determined temperature to attach the reticle to the selected pellicle frame,  
wherein the inner pellicle frame has a coefficient of thermal expansion that is greater than or equal to a coefficient of thermal expansion of the outer pellicle frame.
2. (Original) The method of Claim 1, wherein the polymer layer has a melting point between about 60 to 150 degrees Celsius.

3. (Original) The method of Claim 1, wherein said heating heats the polymer layer between about 45 to 150 degrees Celsius.

4. (Previously Presented) The method of Claim 1, further comprising applying pressure to the reticle and the selected pellicle frame during said heating.

5. (Original) The method of Claim 1, wherein the polymer layer comprises a thermoplastic.

6. (Original) The method of Claim 1, further comprising forming a hermetic seal between the reticle and the pellicle frame.

7. (Previously Presented) The method of Claim 1, further comprising cutting the polymer layer to match a bottom surface area of the selected pellicle frame.

8. (Previously Presented) The method of Claim 1, wherein said heating is local to the polymer layer bonding the selected pellicle frame to the reticle.

9-17. (Canceled).

18. (Previously Presented) The method of Claim 1, wherein the pellicle is mechanically clamped within the outer pellicle frame and the inner pellicle frame.

19. (Canceled)

20. (Previously Presented) The method of Claim 1, wherein the inner pellicle frame has a coefficient of thermal expansion that is greater than the polymer layer and the same as the outer pellicle frame.

21. (Currently Amended) The method of claim 1, wherein:  
placing the pellicle comprises mechanically clamping a flexible pellicle membrane between the outer pellicle frame and the inner pellicle frame to hold the flexible pellicle membrane stretched across the inner pellicle frame without using an adhesive;

placing the polymer layer comprises positioning a ~~low outgas~~ thermoplastic polymer between the selected one of the outer pellicle frame and the inner pellicle frame and the reticle; and

heating the polymer layer comprises heating the ~~low-outgas~~ thermoplastic polymer to couple the low outgas thermoplastic polymer to the pellicle frame and to the reticle.

22. (Currently Amended) The method of claim 21, wherein the ~~low-outgas~~ thermoplastic polymer comprises a polyester thermoplastic.

23. (Previously Presented) The method of claim 21, wherein coupling the pellicle frame to the reticle comprises bonding the pellicle frame to the reticle.

24. (Currently Amended) The system of claim 27, wherein the thermoplastic polymer comprises a ~~low-outgas~~ polyester attaching the pellicle frame to the reticle without using an adhesive and with the pellicle membrane covering the pattern on the reticle.

25. (Previously Presented) The system of claim 27, wherein the pellicle frame further comprises a mechanical clamp to hold the flexible pellicle membrane spanned across the pellicle frame without using an adhesive.

26. (Canceled)

27. (Previously Presented) A system comprising:  
a reticle having a pattern formed thereon;  
a flexible pellicle membrane;  
a pellicle frame comprising an inner frame member and an outer frame member to mechanically clamp the flexible pellicle membrane therebetween and stretch the flexible pellicle membrane spanned across the pellicle frame; and

a thermoplastic polymer to couple the inner frame member of the pellicle frame to the reticle with the flexible pellicle membrane covering the pattern on the reticle,

wherein the outer frame member remains otherwise unattached to the reticle, and

wherein the inner pellicle frame has a coefficient of thermal expansion that is greater than or equal to a coefficient of thermal expansion of the outer pellicle frame.

28. (Previously Presented) The system of claim 27, wherein

the inner frame member comprises an inner frame;

the outer frame member comprises an outer frame; and

the inner frame and the outer frame are sized and shaped to clamp together by a snap action.
